

Pain Diary

A convenient way to save NHS appointments, whilst gathering data to improve treatment pathways.

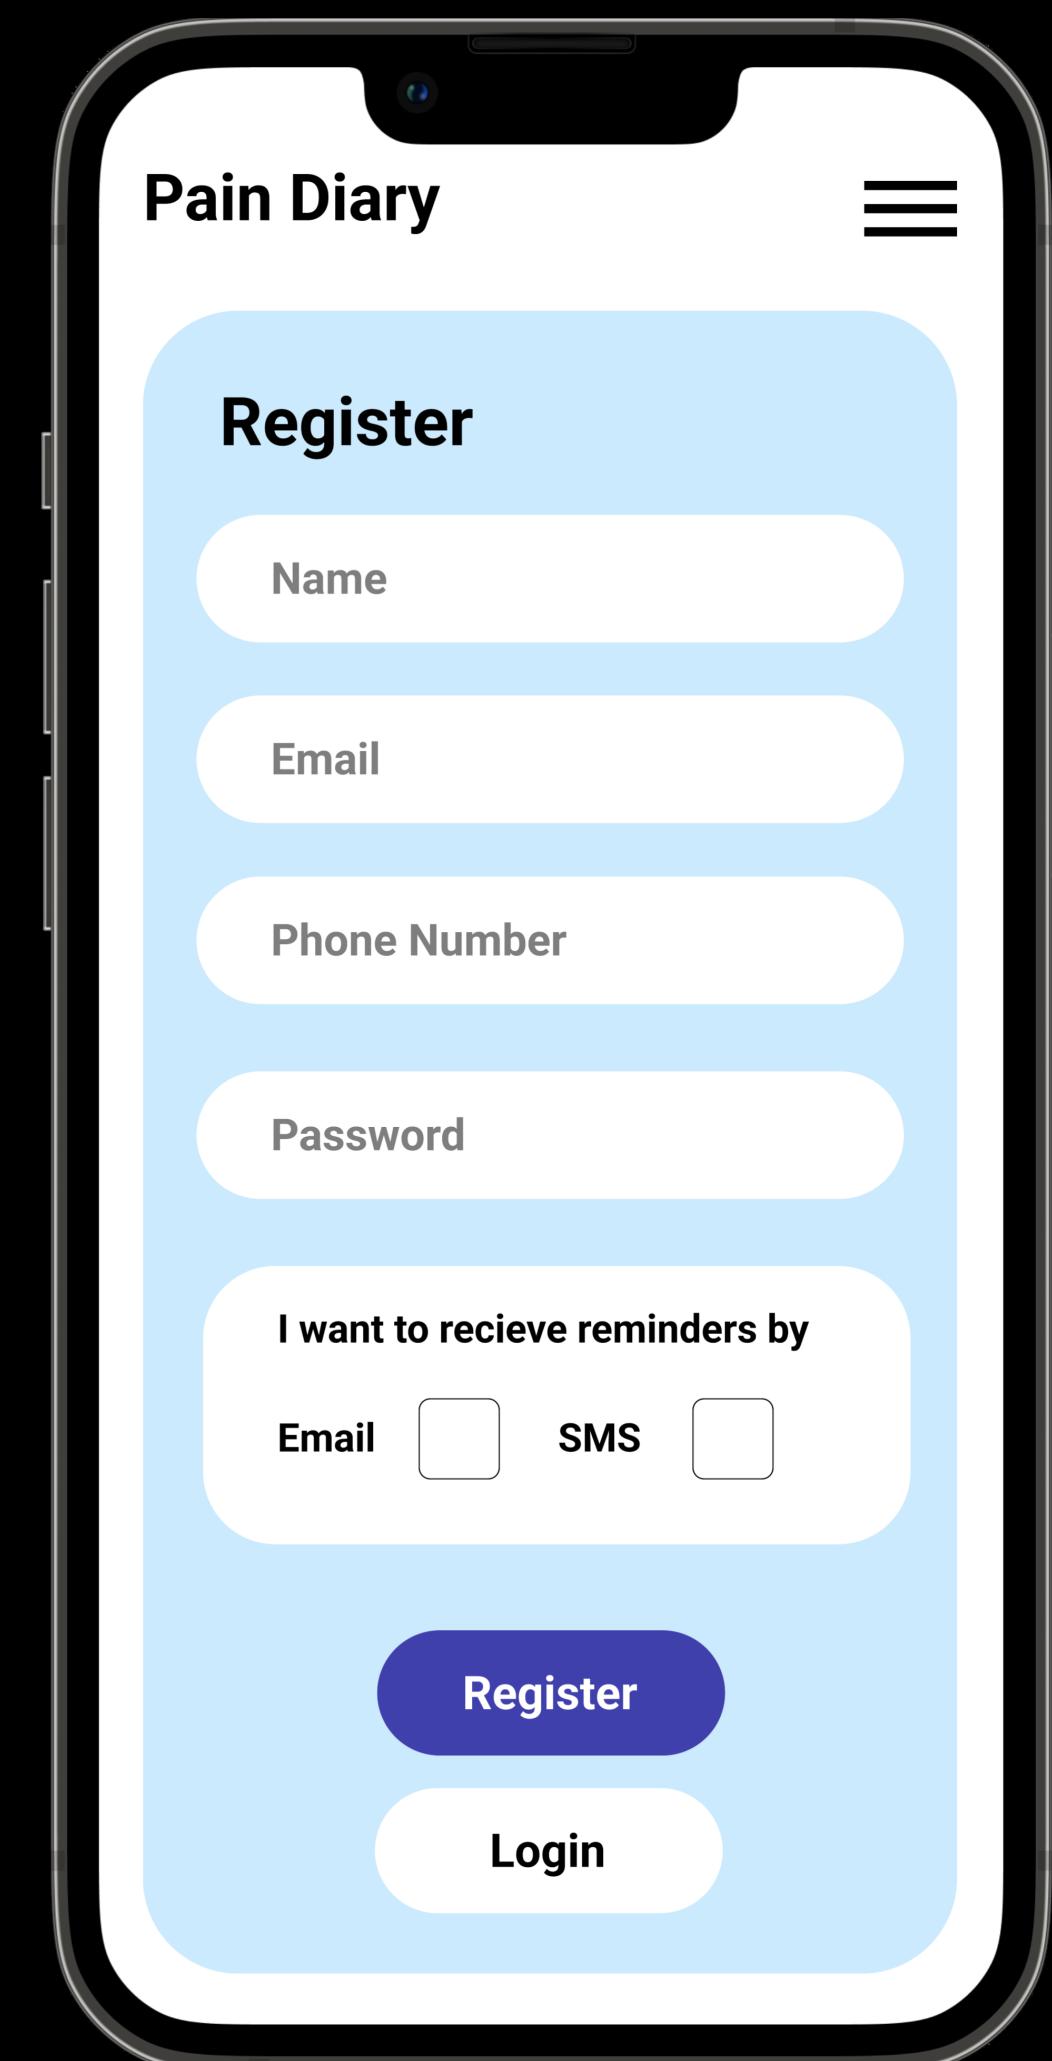

Problem

Doctors giving pain treatment medication rely on a follow up appointment to make their next decision. These appointments cost the NHS time and money.

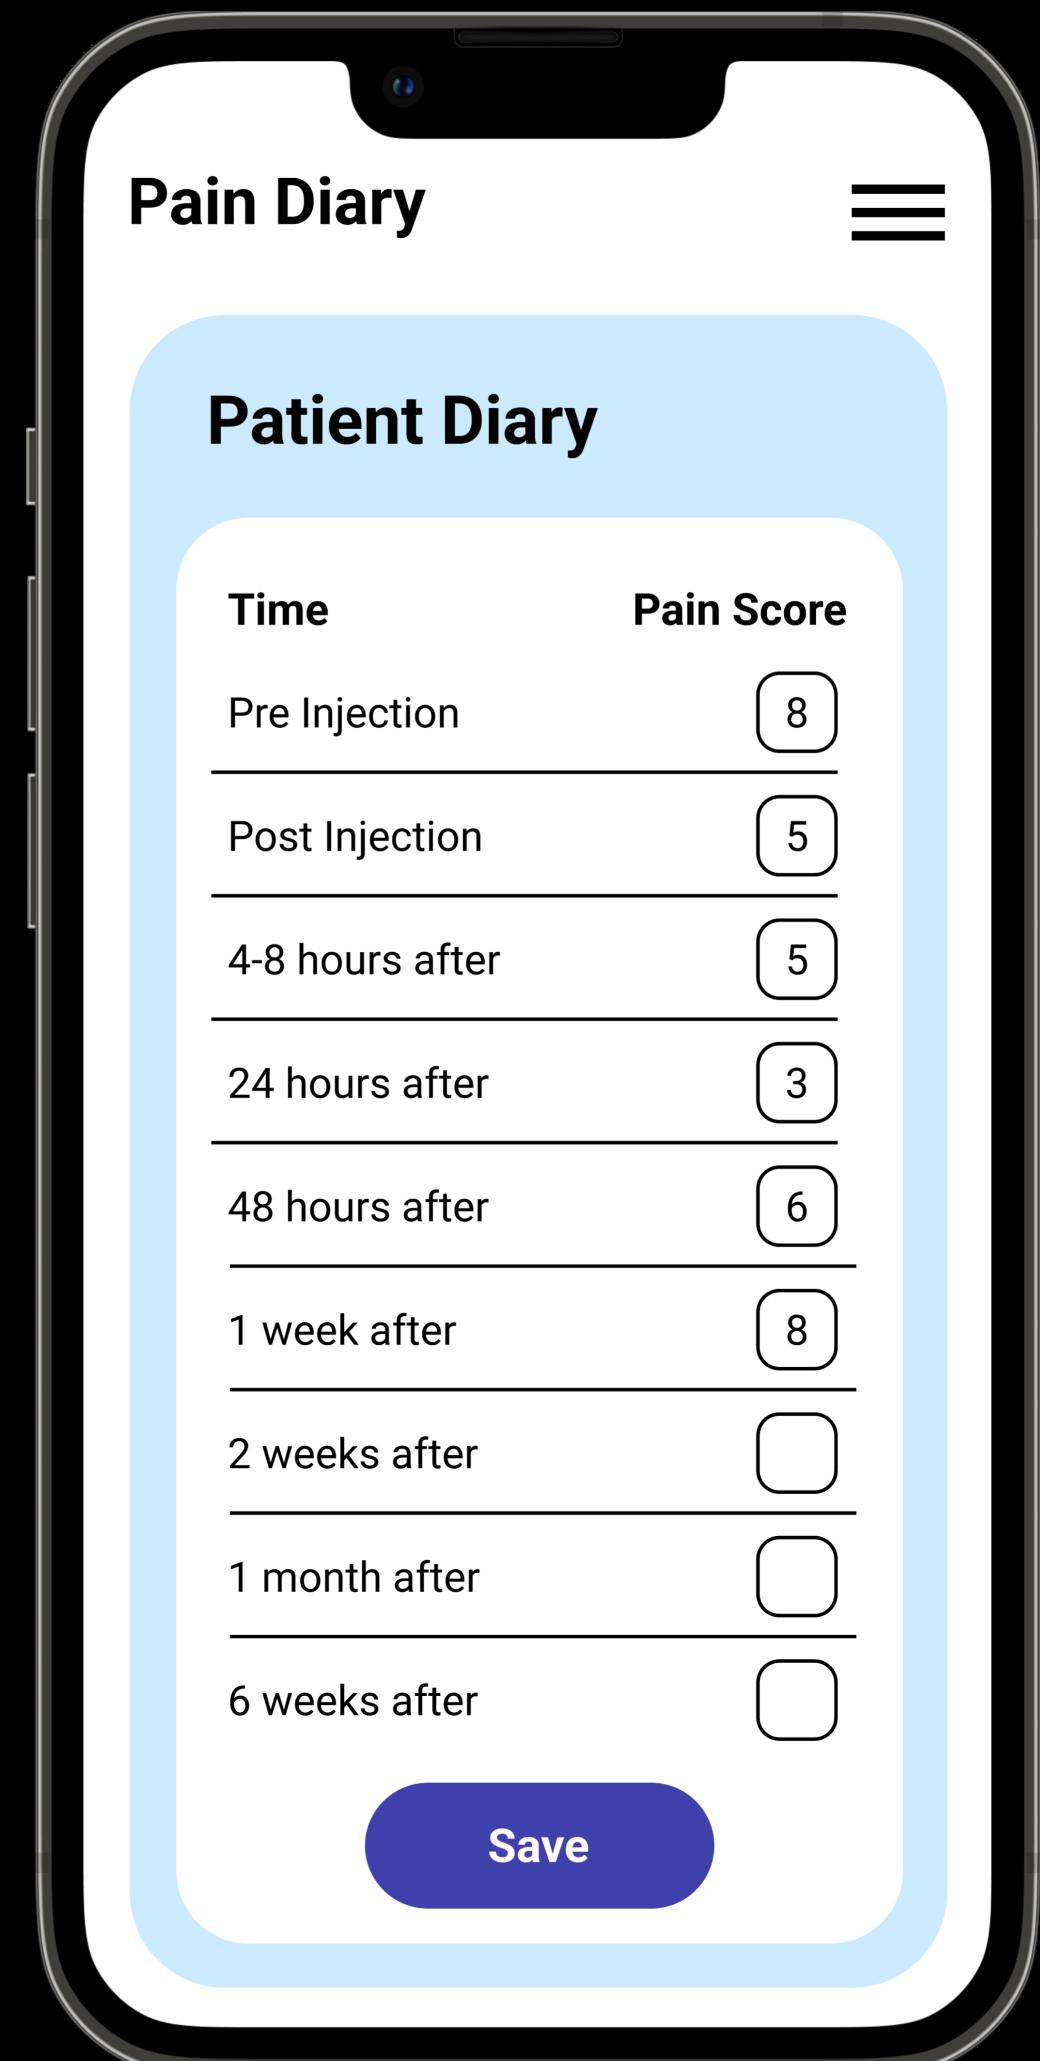

Concept

Using a browser based app, users can log their pain after treatment to be fed back directly to the specialties.

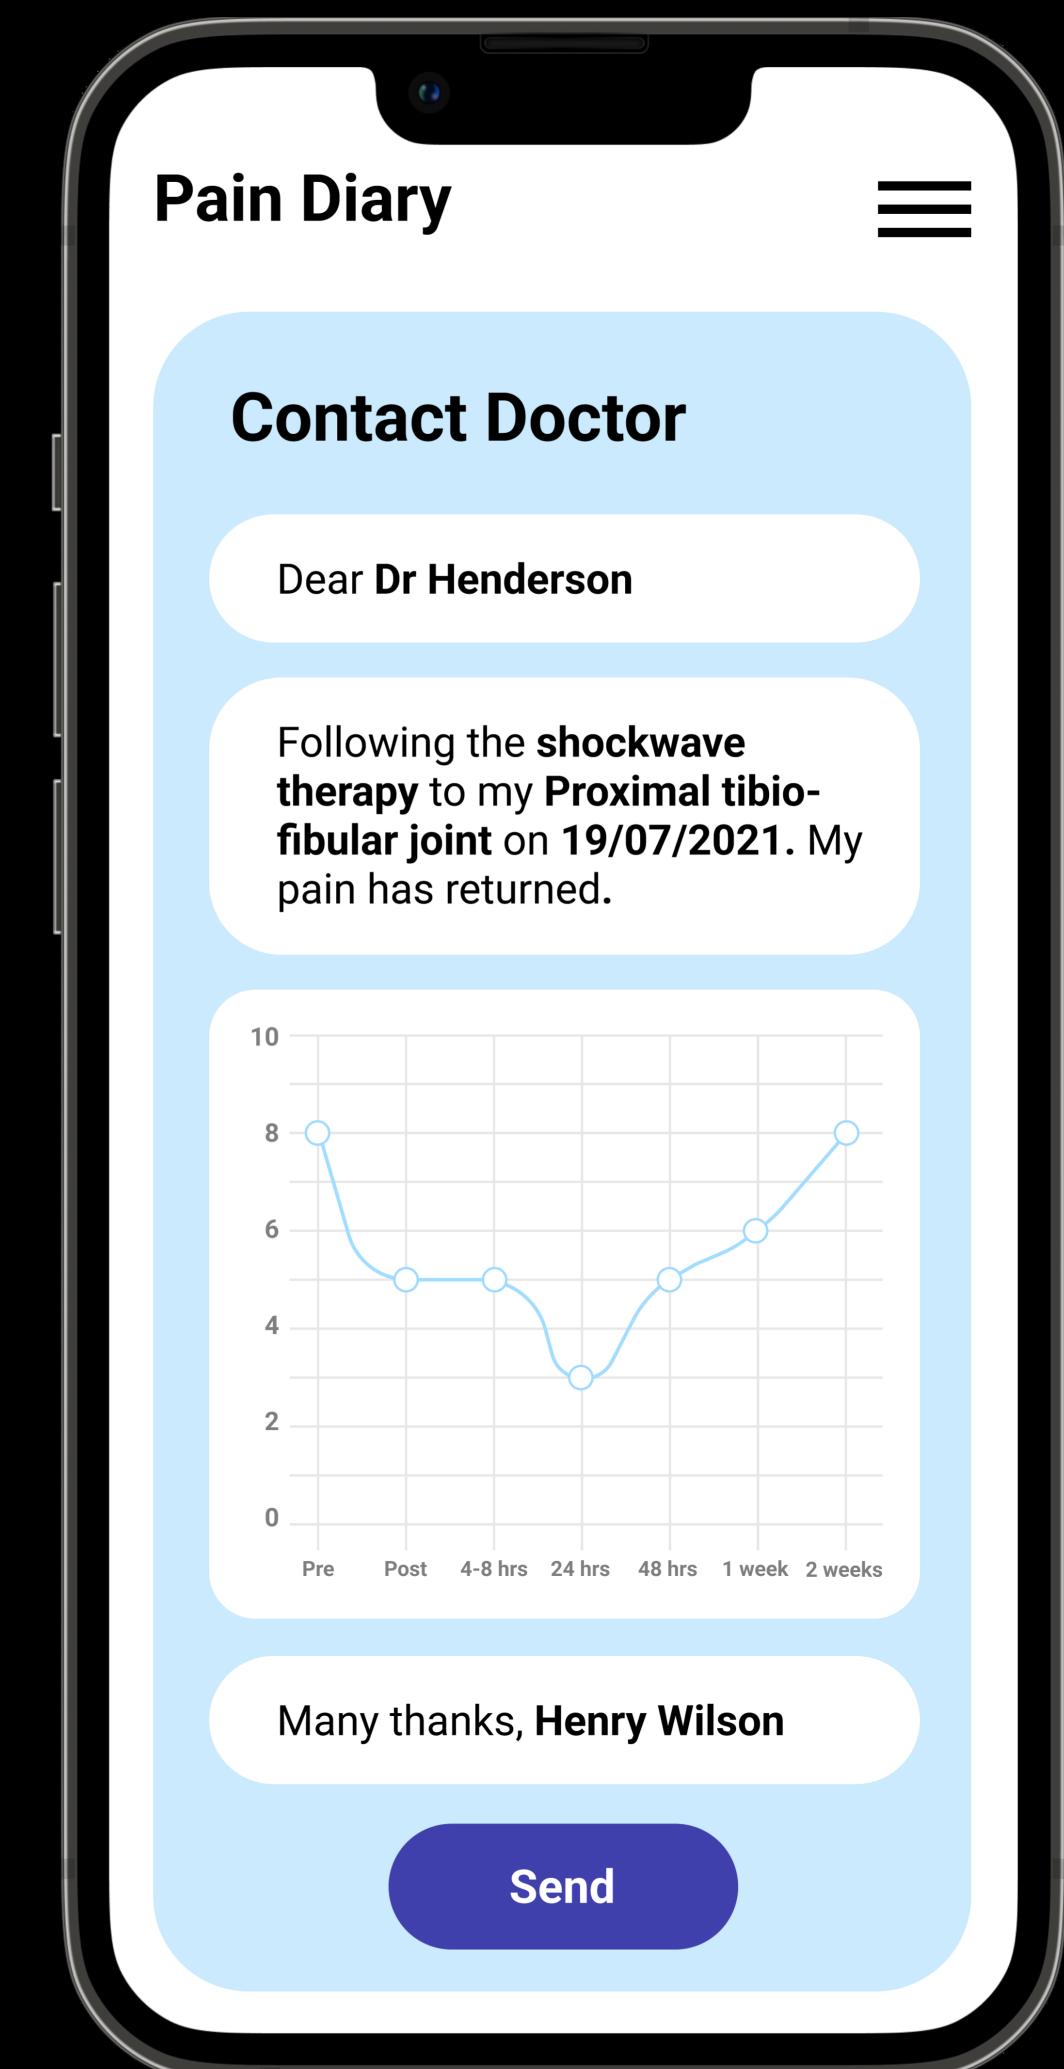

How it works

Patients make diaries when they receive a pain treatment. They then receive email/SMS reminders log scores at intervals determined by the treatment.

Integration

Once the diary is complete, or pain starts to spike, the results can be returned directly to the specialist, for filing into any NHS patient's notes.

Testing

Initial testing of the app is underway at the Royal Surrey County Hospital.

Use the Data

By recording all the patient data in one place, analysis on the efficacy of each treatment can be used to improve standard practice.

Funding

To develop the app from its beta state to be suitable for national roll out, the security and testing are of the highest importance.
